

Life in Numbers - Project Synopsis

Introduction

Life in Numbers is an interactive web application that transforms a user's daily habits into meaningful and visually engaging life statistics. Users enter information such as age, sleep duration, screen time, exercise routine, reading habits, walking distance, and other lifestyle activities. Using HTML, CSS, and JavaScript, the application calculates how these everyday habits accumulate over time and presents the results through attractive visual elements, animations, and personalized insights.

Problem Statement

People often perform daily activities without realizing their long-term impact. Life in Numbers converts everyday habits into meaningful life insights and relatable comparisons through an engaging web interface.

Objectives

Develop an interactive web application using HTML, CSS, and JavaScript; collect lifestyle information; perform real-time calculations; visualize results through interactive cards and animations; and improve awareness of personal habits.

Features

User-friendly input form, personalized lifestyle analysis, interactive dashboard, real-time calculations, animated statistic cards, progress bars, fun comparisons, Life Snapshot, responsive design, and Local Storage support.

Technologies Used

HTML5, CSS3, JavaScript, and Local Storage.

Modules

Home Page, User Information, Life Analysis, Interactive Dashboard, and Life Snapshot.

Expected Outcome

The application provides personalized insights such as years spent sleeping, distance walked, screen-time analysis, and savings predictions in a visually appealing format.

Future Scope

User authentication, cloud database, AI suggestions, habit tracking, achievement badges, PDF export, and a mobile application.

Conclusion

Life in Numbers demonstrates how HTML, CSS, and JavaScript can create an engaging web experience by turning everyday habits into meaningful stories and interactive visual insights.
